

Assessment Test: Software Tester (QA)

Full Name: Sagar Kumar

Email ID: sagar.kumar.cs.2023@mitmeerut.acin

College: MIT Meerut

1. Registration

TC ID	Test Case	Expected Result	Type
R-1	Register with valid name, email and password.	User should be registered successfully.	Positive
R-2	Register with an already registered email.	Proper error message should be shown.	Negative
R-3	Enter an invalid email such as abc@.	Registration should not be allowed.	Negative
R-4	Leave required fields empty.	Validation message should be displayed.	Negative
R-5	Enter a password below the minimum length.	Error message should be displayed.	Negative
R-6	Enter password with the valid minimum length.	Registration should be successful.	Positive
R-7	Enter only spaces equal to the minimum password length.	Registration should not be successful.	Edge
R-8	Enter only spaces in required fields.	Input should be validated properly.	Edge
R-9	Enter very long input values.	Application should handle them without crashing.	Edge

2. Login

TC ID	Test Case	Expected Result	Type
L-1	Login using valid email and password.	User should be logged in successfully.	Positive
L-2	Use correct email with wrong password.	Login should fail with an error message.	Negative
L-3	Login with an unregistered email.	Login should fail.	Negative
L-4	Keep email or password empty.	Validation message should be shown.	Negative
L-5	Enter an invalid email format.	Proper validation message should be displayed.	Negative
L-6	Enter password with spaces or special characters.	Application should handle it correctly.	Edge
L-7	Try login multiple times with wrong password.	Repeated failed attempts should be handled properly.	Edge
L-8	Enter the correct email and password with extra spaces before/after the email.	Application should handle it correctly.	Edge

3. Task CRUD Operations

- Create:** create a task including valid details; the task must be created and stored in the database.
- Read/View:** Open the list of tasks and verify that all the tasks which have been created are displayed.
- Update/Edit:** You can edit a task that has already been created. Only the task that has been selected should be altered.
- Delete:** To delete a task that already exists, it must be removed from the list and also from the database.
- Look at the edge cases, such as an empty task, task details that are extremely long, duplicate task names, and an empty task list.
- To refresh the page: after you have created, edited or deleted a task, refresh the page and verify that the database contains the correct data.

4. Input Validation And Error Handling

- Required fields should not accept empty values.
- Email should be validated for a valid format.
- Very large input should not bring the application to a crashing state.
- Invalid login should result in an appropriate error message.
- Failure in the database or the server should result in a friendly error message.
- Invalid task ID should be handled appropriately.
- Special characters should be handled appropriately.
- Technical database details should not be visible to the end-user.

Bug Identification

Possible bugs areas identified without executing the application.

No.	Possible Bug / Risk	Severity	Reason / Impact
1	User can register with an already registered email.	Major	Duplicate accounts may be created and login may become confusing.
2	Login accepts an incorrect password.	Critical	An unauthorized person may access another user's tasks.
3	Password is stored in plain text.	Critical	User passwords may be exposed if the database is compromised.
4	One user can view another user's tasks.	Critical	This is a serious privacy and security problem.
5	Deleted task appears again after refresh.	Major	The task may be removed only from the screen and not from the database.
6	Edited task is not saved in the database.	Major	Changes may be lost after refreshing the page.
7	Empty task can be created.	Minor	It can create incomplete or useless records.
8	Very large input causes the application to crash.	Major	It may cause application or database failure.
9	Database error displays technical information.	Major	It can confuse users and expose system information.
10	Session is not handled correctly after logout or expiry.	Critical	A user may continue accessing protected task data.
